Problem Set #1

Orrecto

Du the definitions $|V_{\alpha}\rangle < d$ for every single choice of a

Calificación de la entrega mas reciente: 100 %					
1.	Given an adjacency-list representation of a directed graph, where each vertex maintains an array of its outgoing edges (but *not* its incoming edges), how long does it take, in the worst case, to compute the in-degree of a given vertex? As usual, we use n and m to denote the number of vertices and edges, respectively, of the given graph. Also, let k denote the maximum in-degree of a vertex. (Recall that the in-degree of a vertex is the number of edges that enter it.)	1/1 punto			
	\bigcirc $\theta(k)$				
	Cannot determine from the given information				
	\bigcirc $\theta(n)$				
	$leftleftharpoons \theta(m)$				
	Correcto Without explicitly maintaining a list of incoming edges, you might have to scan all the edges to identify the incoming arcs.				
2.	Consider the following problem: given an undirected graph G with n vertices and m edges, and two vertices s and t , does there exist at least one s - t path?	1 / 1 punto			
	If G is given in its adjacency list representation, then the above problem can be solved in $O(m+n)$ time, using BFS or DFS. (Make sure you see why this is true.)				
	Suppose instead that G is given in its adjacency *matrix* representation. What running time is required, in the worst case, to solve the computational problem stated above? (Assume that G has no parallel edges.)				
	$\bigcirc \ \theta(m+n\log n)$				
	$leftleft$ $ heta(n^2)$				
	$\bigcap \theta(n*m)$				
	$\bigcirc \ \theta(m+n)$				
	\odot Correcto For the lower bound, observe that you might need to look at every entry of the adjacency matrix (e.g., if it has only one "1" and the rest are zeroes). One easy way to prove the upper bound is to first build an adjacency list representation (in $\Theta(n^2)$ time, with a single scan over the given adjacency matrix) and then run BFS or DFS as in the video lectures.				
3.	This problem explores the relationship between two definitions about graph distances. In this problem, we consider only graphs that are undirected and connected. The diameter of a graph is the maximum, over all choices of vertices s and t , of the shortest-path distance between s and t . (Recall the shortest-path distance between s and t is the fewest number of edges in an s - t path.)	1 / 1 punto			
	Next, for a vertex s , let $l(s)$ denote the maximum, over all vertices t , of the shortest-path distance between s and t . The $radius$ of a graph is the minimum of $l(s)$ over all choices of the vertex s .				
	Which of the following inequalities always hold (i.e., in every undirected connected graph) for the radius r and the diameter d ? [Select all that apply.]				
	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $				
	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $				
	$lacksquare r \leq d$				

a graph G that is NOT directed acyclic. Obviously it won't compute a topological order (since none exist). Does it compute an ordering that minimizes the number of edges that go backward? For example, consider the four-node graph with the six directed edges (s,v) , (s,w) , (v,w) , (v,t) , (w,t) , (t,s) . Suppose the vertices are ordered s , v , w , t . Then there is one backwards arc, the (t,s) arc. No ordering of the vertices has zero backwards arcs, and some have more than one. Ordering of the graph is a directed cycle Never Sometimes yes, sometimes no Always		by the definitions, $\iota(s) \geq a$ for every single choice of s .	
Let c minimize $I(s)$ over all vertices s . Since every pair of vertices s and t have paths to e with at most r edges, stitching these paths together yields an s - t with only $2r$ edges; of course, the shortest s - t path is only shorter. 4. Consider our algorithm for computing a topological ordering that is based on depth-first search (i.e., NOT the "straightforward solution"). Suppose we run this algorithm on a graph G that is NOT directed acyclic. Obviously it won't compute a topological order (since none exist). Does it compute an ordering that minimizes the number of edges that go backward? For example, consider the four-node graph with the six directed edges $(s, v), (s, w), (v, w), (v, t), (w, t), (t, s)$. Suppose the vertices are ordered s , v , w , t . Then there is one backwards arc. the (t, s) arc. No ordering of the vertices has zero backwards arcs, and some have more than one. If and only if the graph is a directed cycle Never Never Then there is one than 0 in the graph is a directed graph G , the number of strongly connected components? In adding one extra edge to a directed graph G , the number of strongly connected components? never decreases by more than 1 (no matter what G is) unever decreases from matter what G is) never decreases (no matter what G is) never decreases (no matter what G is) never decreases (no matter what G is)	✓ r	$\geq d/2$	
a graph G that is NOT directed acyclic. Obviously it won't compute a topological order (since none exist). Does it compute an ordering that minimizes the number of edges that go backward? For example, consider the four-node graph with the six directed edges $(s, v), (s, w), (v, w), (v, t), (w, t), (w, t), (t, s)$. Suppose the vertices are ordered s, v, w, t . Then there is one backwards arc, the (t, s) arc. No ordering of the vertices has zero backwards arcs, and some have more than one. Of if and only if the graph is a directed cycle Never Sometimes yes, sometimes no Always Orrecto To recto on adding one extra edge to a directed graph G , the number of strongly connected components? never decreases by more than 1 (no matter what G is) will definitely not change (no matter what G is) never decreases (no matter what G is) never decreases (no matter what G is)	ı	Let c minimize $l(s)$ over all vertices s . Since every pair of vertices s and t have paths to c with at most r edges, stitching these paths together yields an s - t with only	
one backwards arc, the (t, s) arc. No ordering of the vertices has zero backwards arcs, and some have more than one. ○ If and only if the graph is a directed cycle ○ Never ⑥ Sometimes yes, sometimes no ○ Always ○ Correcto 5. On adding one extra edge to a directed graph G , the number of strongly connected components? ○never decreases by more than 1 (no matter what G is) ○will definitely not change (no matter what G is) ⑥could remain the same (for some graphs G) ○never decreases (no matter what G is) ○never decreases (no matter what G is)	a grapi that go	h G that is NOT directed acyclic. Obviously it won't compute a topological order (since none exist). Does it compute an ordering that minimizes the number of edges backward?	
 Sometimes yes, sometimes no Always Correcto 5, On adding one extra edge to a directed graph G, the number of strongly connected components? never decreases by more than 1 (no matter what G is) will definitely not change (no matter what G is) could remain the same (for some graphs G) never decreases (no matter what G is) ✓ correcto 	one ba	ackwards arc, the (t,s) arc. No ordering of the vertices has zero backwards arcs, and some have more than one.	
 Always ✓ correcto 5. On adding one extra edge to a directed graph G, the number of strongly connected components? ✓never decreases by more than 1 (no matter what G is) ✓will definitely not change (no matter what G is) ✓could remain the same (for some graphs G) ✓never decreases (no matter what G is) 	_		
 5. On adding one extra edge to a directed graph <i>G</i>, the number of strongly connected components? never decreases by more than 1 (no matter what <i>G</i> is) will definitely not change (no matter what <i>G</i> is) could remain the same (for some graphs <i>G</i>) never decreases (no matter what <i>G</i> is) never decreases (no matter what <i>G</i> is) 			
\bigcirc never decreases by more than 1 (no matter what G is) \bigcirc will definitely not change (no matter what G is) \bigcirc could remain the same (for some graphs G) \bigcirc never decreases (no matter what G is) \bigcirc Correcto	⊘ (Correcto	
\bigcirc will definitely not change (no matter what G is) \bigcirc could remain the same (for some graphs G) \bigcirc never decreases (no matter what G is) \bigcirc Correcto	5. On add	ding one extra edge to a directed graph G , the number of strongly connected components?
